Ok … good thing is I think I'm mending decently considering most have said it difficult to not move the fly if drag has set in … especially at me level/experience.

So you have abt 2 seconds b4 they will usually spit it out, I'm assuming?

> Watching you fish, I noticed you were casting directly across stream, with a pretty straight line between you and the fly. This is gonna make your fly drag almost immediately in any kind of current.

Which touches on what Krayfish wrote … I am going to try to get out (if I can find the time) one evening this week to practice some more. I will get less drag casting up stream @ an angel, which now I do often when nymphing, instead of always going directly across.

> Concentrate on mending before drag affects your drift, and don't expect to get tremendously long drag free drifts at this point in your game. Try to time the drift so that your fly passes over the fish while not dragging.

This is good right here. I have always mended when drag sets in .. you are basically saying give some mends once ur fly hits the H2O … which I didn't think abt but totally get.

///Thanks for article … looked over quickly but bookmarked
