Every time I fish with a particular friend something bad happens to me or my equipment: rod cracks, loose a lot of flies. This time was no different. My waders got a slice in the stocking material. but don't ask me how. The gouge is not completely through, but it allows water to seep in.

Is there any way to fix them?

He told me to buy a special type of glue/epoxy. I thought of sewing the cut with heavy duty thread.

Also, do you guys think it is possible to turn them into thigh-high waders by cutting them and stitching in a band of elastic?
