Yes, WullMan, that was a typo. 300 times per hour, which is 5 times per minute. I swear that all of the other details were right, though!!!

Here's another nugget: The trout in the study would move into the pool that was being observed at about three inches and pick a rock. The fish would use that rock as their feeding spot for the rest of their lives, returning to it after each annual spawning run upstream. Can you believe that fish live in the same pool all their lives? I have suspected that I caught the same fish from the same pool several times (a particular large rainbow in Spring Creek) but I never would have suspected that trout stay in one spot forever.

BTW, he identified all of the fish by their patterns of spots. There was one he called Beethoven because its dots went "dot dot dot dot."
