In my humble opinion, dam removal is beneficial to all fish populations.

Obviously, we are on a forum that leans towards trout, but, again in my humble opinion, if trout were meant to be in a given waterway...they are going to be in that waterway - regardless of a dam being present or not.

You know dams ruin fish populations...where are you coming from with this post?

Where I'm coming from is:

- 1) In some cases dam removals increase trout populations.
- 2) In some cases dam removals decrease trout populations significantly and essentially permanently.

It depends on the physical conditions of the stream, floodplain and dam itself.
