you make a fatal error and call these fish steelhead... they aren't  
the are lake run rainbows

the genetic inbreeding has led to no diversity, natural selection, or survival of the fittest... creating a weak  
inbred population that is overstocked by a program driven by \$\$\$ rather than management of a resource

Quote:

At this time of year, many fish are still very actively on the move.

this time of year??? we are just a few days from full freeze  
the water is in the mid 30s  
where are these fish moving??? they are already in upper elk

I managed a few good hookups but no fair hooked fish landed.  
We had many foul hooks due to the large amount of fish, and the low clear water.

this speaks volumes...  
the fish were in low clear water because you herded them there  
what makes you think any of the fish you lost were legit???

these fish get stuck in gin clear bathtubs... they try to find cover, until peoples idiotic antics push them out into  
water with no cover, and the start foul hooking them

force feeding- standing over a fish and hitting it on the nose 30 times with a tandem rig and then on the 31 it  
mouths the fly
