the government give the utility companies 1.5 cents per kWh. so the more wind power they produce the more of our taxes they get so we end up paying more for the energy. also it costs about 5 cents per kWh to produce the power for a very efficient, constant, high wind area, unlike what we have here in the eastern USA. also the most wind is produces at night when power usage is lowest. so in reality if a wind farm is designed to produce 50 kWh of power, it's out put is more like 20 kWh. this in turn drives up costs which is charged back to the customer. the only reason utilities are building these is because the government is paying them to build it. if this were to happen in any other business, like banking or loans, there would be a great out cry of too much governemnt involvment.
