Count me in on the musky JAM too.... 😊

Anyway, the fish in the photo is a heckuva musky. Imagine, the PA state record from Conneaut Lake is bigger still! I think our state record muskie may continue to stand for a long time. The photo of the Michigan fish is also a neat study in the different color patterns typical of different strains of muskellunge. This fish is typical of great lakes muskies and esp those from Lake St Clair and the St Lawrence River. Note the profuse leopard spots. You almost never see these thick, nickel sized spots on PA muskies. Our fish are predominately Chautauqua Lake strain and usually show a greener hue with vertical stripes much like the one in Sandfly's photo from the Tioga River.

I usually do some winter fishing for river muskies on the Potomac and Juniata Rivers (although usually with conventional tackle) - looking forward to it once the waterways settle down a bit. Awesome fish.
