Foam Beetle

I have just started doing some simple tying and had a question. Since I mainly fish Clarks Creek at this time of year I am trying foam beetles and ants. I have been having problems keeping the foam on top of the hook after finishing the fly. The foam always is able to rotate around the hook. How do I go about correcting this problem? Also, how are rubber legs tied into the pattern? All the books and websites I have seen do not cover these topics.

Thanks.
