I nail knot a piece of 20 - 25 lb mono to the fly line with a surgeon's loop on the other end to do exactly what you are suggesting. Then I can loop-to-loop any leader I want and change leaders in a flash. 6" or so does the trick. Taught to me by a veteran years ago. If you want to be precise, measure the width of the butt end of your leader and make the connection the same as or slightly thicker. I just have a couple of spools of at least 20 and use it.
