It is true that often times wild and stocked trout in PA travel a great deal and will seek larger waters and their more diverse forage base if the conditions permit. This leads to trout in fall and winter moving downstream from first order streams to second order streams even if they are WWF (warm water fisheries).

Without naming names, you can pretty much find nearly any large warm water stream and if it has stocked trout tributaries, expect to find trout there near the mouths at least in the early season before the waters warm beyond the trouts comfort level of 70 degrees or so.
