In addition to what everyone has suggested so far, look for trails of bubbles on the water surface, which often mark seams, when reading the water.

A seam is the dividing line at which a faster current and a slower current meet. Food items will often be concentrated at seams, and fish will often hold near them so that they will not have to work as hard to find and grab food items drifting by.

Seams which pass over relatively deep areas, and which have good cover, such as overhanging vegetation, or undercut banks, will often be good places to find fish. Be careful when casting to these spots; streamside bushes have a healthy appetite for flies too 😊
