don't get your line stuck in the blades!!

seriously, I feel that as our oil/gas reserves dry up, we will be forced to turn to renewables, wind, solar, nuclear, etc.

honestly, there is no reason why every home built in the southwestern part of our country shouldn't have solar panels on the roofs. the technology is there, costs keep coming down. and if you happen to live in a windy place and have the room, you'd be crazy not to have a windmill.

personally, I will add solar panels to my garage when I have the available funds. will it be enough to power my house, no, it might not even provide 20 percent of what I use, but it's a start. I think our society has gotten to a point where we just don't care where the power comes from, as long the lights come on and the tv works.

what about stream/riverside generators? there has to be ways to get power out of our waters without building dams.

we need to start supplementing our power supplies, even if it's a small percentage, it all adds up. I'm sure people will chime in and say I'm full of crap and I don't have a clue what I'm talking about, but what's thier plan for when the oil and gas runs out? and it will run out.
