bikerfish.....according to a friend that works at Gamesa in Ebensburg , they plan on marketing a "Home version" of their windpower system , that and solar panels might get you what you need. Seriously , the newest theory from the science end is that the earth is abiotic , it manufactures oil consistantly , and replenishes oil over time , even if this is true , and they find we'll never run out of oil , if we can serve our power needs without creating pollution to do it then we should. If we can get electricity from sources that don't create pollution even though coal and oil may be cheaper spending a little more so we don't destroy the place is ok with me.
