How can the future be bright if we have no place to fish in 30 years? That is an exaggeration, but you get the point. This private land thing has taken many miles of trout water from us already. Do you really believe that is going to get any better? I doubt it.

We might be thinking smarter about the environment, but our world is way too populated. Buildings are being built everywhere around our trout streams and that is not helping. PA has changed so much in 20 years. What do you think it will look like in 50 years?
