They = big business/oil companies

And yes they want us to use the product as long as they can make us.

One could argue that everyone could stop driving but that is kind of not really realistic. One could also argue to change your heating unit to solar but that is also expensive and with everything going up in price.....isnt realistic either.

See, thats just it. Your putting the onus on them, but they're in no different situation. These companies are energy suppliers. You say its not realistic to use renewables on the home scale. I am not sure I agree, but assuming thats true, then what makes you think its different on a larger scale? Both wind and solar have the drawback that the economy of scale really doesn't gain you a whole lot.

It's just not a feasible position to say:

I demand a lot of energy. I demand it be cheap. I am not willing to do it myself, I want it delivered to me. But its not my fault that the suppliers offer only large-scale, cheap sources of energy. It must be a conspiracy.

That's what you're doing. You act like we give them a choice. We don't. They offer what we demand, in the only way they can. They are not capable of offering clean energy in the amounts we demand, at the price we demand. It's not that they don't want to, it's that they can't. We like to say we want renewables, but we don't act the part, we're not willing to pay the price.
