in the past this reservoir has pumped out 55 F water all summer long. The Corps apparently is blaming the temps on valve issues and the fact they are meeting Ch 93 minimum temp targets. But between April and mid-May the temps were 45 F...????

Its not freakin rocket science...just a matter of manipulating the valves differently at various times of the year.

Both agencies PFBC & ACOE are dropping the ball on this one. One of which is being blatant, the other is lack of making an effort... The entire thing stinks

What a waste of a trout fishery.... 😞
