Hi All,

Would appreciate your opinions on what type of leader to use while nymphing.

Currently I use a tapered leader. I fish with and without an indicator. When using an indicator with a tapered leader and a long lead, **I feel that the heavier length of tapered leader does not allow the nymphs to sink properly and are is affected more by current that does not allow for an effective drift.**

Can anyone share your leader techniques when nymphing with an indicator?

Appreciate any suggestions.

Thanks,

Dale

Dale, truer words have never been spoken.

IMO, the biggest mistake I see most FFers make is to move their indy up on leader and have the heavy diameter line below the indy preventing the flies from sinking and introducing drag. I've seen guys fish rigged like that with a gang of split on to get their 80lb test leader butt to sink, and dragging their fly through the current....if Moby Dick hit their fly they probably wouldn't even know it.

There's a lot of ways to rig for nymphing. I've used many different ones over the years: extruded mono tapered leaders (aka "store bought"), knotted mono tapered leaders that I made myself, straight mono, "sighter" with both braided line and amnesia in front of leader and tippet, as well as some other ones I'm sure I've forgotten about.

I've settled on using the furred mono leaders I make for nymphing. They float well, I use paste floatant on them so they do not effect the drift and mend easily. Many of the furred leaders you buy can work well for you too.

I smear some strike putty on them at a few points to use as a sighter or you can incorporate some hi-vis mono into the leader. I tie in an average of 4 - 6' of tippet material to the leader and use the floating leader as my indy. If I use an actual floating indy, I attach it to the long thin diameter tippet and have tippet only between the indy and the flies. That allows my flies to sink quickly (using less weight) and with little or no drag on the flies.

I weight most of my flies and try to use as little split-shot or tungsten putty on my tippet as possible for sensitivity.

HTH.

I think this is great advice afishinado. Personally I have been picking up less fish nymphing than say a few months ago and really didn't know why. Your reply could be my answer. Thank you

This post along with the multiple recommendations from members of the board to fish dry flies downstream could be the 2 most important things I learned on the board this year. FWIW
