Warm Weather Trout is an oxymoron in some cases. Trout do not live in nor will they survive in waters over 70 degrees. They prefer upper 30's to 50's. Brown trout can survive in temperatures warmer than Rainbows can survive. This makes your question difficult.

Trout will manage to find cold water whether it be a tributary or a permanent water drainage system.

If you are fishing an area where water is let out regularly there is a good chance that with new water there will be good trout populations. If not a system look for where fresh springs trickle into a stream and a smaller stream can hold large fish in these hot summer months, so don't be afraid to cast where you can't see over a rock, they like to hide, and they like to eat, so don't give yourself up, and don't pass up any pools.

Summer trout fishing is an art, and should be treated as such. Good luck.
