I have noticed in SC PA that the invasive stink bug beetles are currently making a big migration indoors. Perhaps that is a good omen of cool weather being here to stay, though a nuisance to your dwelling.

I've noticed 'em too. Ants are suddenly on the move around here as well. I think it might have something to do with the extreme heat and dryness that has persisted for so long now suddenly followed but wet conditions. While I've never seen, that I can recall, a trout eating these stink bugs, their general profile - wide and flat - would likely be a trigger. I think beetles and terrestrials are under rated for trout fishing in the fall. Everyone wants to chase olives but, most of the time, I think terrestrials are your best bet in the period up until late Nov for dry fly fishing.
