Ok, I know that I have asked several questions regarding fly fishing for trout in western PA. Now I have a question that may seem very basic and not real interesting for most of the people on this site. But what is the difference between cold and warm water streams. I am not use to fishing streams and want to learn more to understand the eco systems in each of these types. So the connie is considered a warm water stream... Why? The Slippery Rock and Ness. is considered cold water streams. Why? Can some one explain this to me in way that will help me and other new to stream fishing?

Thanks,

Dave
