I think your right Jack. the dep and/or relate industrial types may get that data, the general public probably isn't allowed access, which is fine if nothing harmful is happening, but when they are pumping the crap past your well water under extreme pressure, I'd sure as hell like to know what's in it! just wondering, if the pressure they pump it in at is high enough to fracture rock, wouldn't it be able to frackure the concrete casing also? I mean, if it can fracture rock that is up to 2 miles beneath the surface of the earth, that would take some serious pressure. maybe they don't think concrete can crack.

back to the topic. I don't care what's in it, I don't want to drink it. I don't want it pumped past my water supply. would the drillers pump it past thier own wells at home? maybe we should ask them
