Unless i'm mistaken which i could be , there are no frackwater treatment plants , they use existing sewage treatment plants to treat the frackwater and they don't do a thorough job. There is a device that evaporates the leftover water but it's patent pending i beleive. out west the water left in the pits naturally evaporates due to the weather conditions but here that doesn't happen , what happens is we get one of our famous flash floods and the water ends up in the nearest creek.
