Ok, I'm getting confused.

The original question: What conditions favor a strong spinner fall? Presumably the purpose is to increase one's chances of timing it right.

You hold that a good hatch of duns makes a good spinner fall, but then also agree that local weather conditions can have a great effect on the strength, timing, duration, etc. of the spinner fall.

I don't think that gets anyone any closer to a usable truth. What we want to know is which weather conditions cause what?

FWIW, the one thing we are all agreeing on is wind. Wind is a bad sign for your chance of getting a good spinner fall that day.
