If you just drop something into the water, it'll bumble along in the current, completely at the mercy there of.

If you drop something in the water with 30' of fishing line attached to it, it'll just bumble along in the current for a foot or so until some portion of that 30' of line gets caught up in some current and starts making that little thing act all unnatural, that would be in any way that's not essentially at the mercy of the water's flow.

Someone could come along and argue that things swim, and they're right, but don't get hung up on nuances. They call it "dead drift" for a reason.
