Someone could come along and argue that things swim, and they're right, but don't get hung up on nuances. They call it "dead drift" for a reason.

Ya but Isonyia swim rapidly to the bank and stripping them . . . .

Seriously, pretty boy is right here. It's all about the drag (and micro drag). Forget casting, forget the fly box of every fly that's every hatched, forget about WF4DTGPX2000, forget about your dream app. Learn to make your crap look like it is floating naturally in the water. Hell, stop being fancy. Throw some tiny bits of bread out of the water. Watch how it floats. See how it goes the same speed as all the really cool bubbles? See those bubbles? Ya, that around where you want to be. Your flies, both surface and subsurface need to flowing at the speed of bugs in that given section of the water column. Once you have done that you can pretty much put bits of feather and dubbing on a hook and catch fish. You will begin to see how much the pattern really doesn't matter. Be the bug . . . . be the bug . . . .

PS, you missed the golden opportunity of a life time to become a master in hours. Today I again went and made a master of a newbie. I can't plan these things for weeks out. I am sporadic. I get the urge to fish and do it.

More PS, did above sound like Jerry? I know rough but seriously, seemed like a solid diatribe.
