I didn't see a reference to you taking it with you on that weekend trip to remote location and using it regularly on the stream.

I'd use it anytime, I never found a line that lived up to its claims. All the floating lines, the maker will just about tell you it's unsinkable. I never had a line yet that wouldn't go under at the tip when using a weighted nymph in a good current, but sometimes I feel that's to my advantage, it helps get the fly down. fishing dry flies, I never had a line pull my fly under. The only time I had a line that I stuck with was back in the either Cortland 333 or 444, or Scientific Anglers Aircel or Aircel Supreme days, I used Aircel Supreme. I always got a couple years on it than turn it around being double taper. Sometimes it would look like gfen's line before I turned it around. I just about lived on the trout stream back then, so it was used hard. I do live on the trout stream now and don't fish as much as I did then.
