As to Brooke Trout;

If the earth is indeed warming by natural causes the brook trout will simply be exposed to changes they have already endured in past thermal cycles. Their range expanded and contracted with the cycles. They will endure. The earth is never a constant. It just appears that way to our small period of time we are granted to experience it.

If the earth is indeed experiencing global warming caused by mans CO2 emissions then the brook trout could be in trouble. One could argue that the thermal changes are happening too quickly for the species to adjust. If you review the model results from proponents of manmade global warming it is too late to have any significant effect this century. If we instituted the most severe measures it only cuts back the temperature change by a degree or so by the end of the century.

The brook trout's fate for our and our children's lifetime is sealed, either way.

This is not to say that if man made global warming was fact that we should not make efforts to resolve the problem. The most effective solutions that engineers and scientists propose would not be those being presented by the current set of politicians.
