I agree with you Tom on the conservation side. We do need to conserve and develop renewable energy sources. It is the right thing to do. Furthermore our technology is to a point where we can do that.

I personally think that we are on the cusp of some emergent technology that will change all of this. Look at the internal combustion engine. Within a decade of its invention the industrial revolution was in full swing. We need that next great leap of innovation.

My problem with the enviro-movement now is that it is dumbed down too much. I understand that you can not present research findings to Joe Six-pack but through dumbing it down so much you are turning hypothesis and theory into dogma and political platforms.

That is not the place for science. It opens doors that should not be opened. You get what we have now. A politician who wraps himself in science to get POLICY changes that he wants. If you question his policy you are labeled as "anti-green". If you question his science you are labeled as ignorant. Who are you to second guess all of these scientists?

Well I am a scientist, and have worked on farms....I know horse crap when I see it.
