Clearly many of them move into faster water in order to feed.

Well, noted about the easier to snag thing in fast water. However, they do hit better in faster water as well. I think it has little to do with moving there to feed, though. These are migratory fish. Once they enter the stream, the instincts related to migration are much stronger than their instincts to feed.

Fish in the holes are resting/holding. Fish in the fast water are active and looking to move. Active fish are more aggressive and it's well known they are easier to catch.

Active fish also tend to be fresher from the lake.
