What Pcray said is dead on. I did a series of papers in school on coyotes and controlling the pops and it doesn't work. Essentially, the only thing that has been proven to control coyote pops is food availability. The females can have multiple litters and the size of said litters is dependent upon her health which is directly dependent on available food. They are one of the most adaptive animals out there, i believe one of the only ones present in all 50 states.
