Native plant and animal species are limited only by their natural diversity and habitat.

For instance, fish are obviously limited by drainage.

Plants are limited by climate (temperature/moisture) and propagated by bird and animal species scattering seeds.

Terrestrial animal species are limited by climate and terrain.

If the coyotes were not planted here and migrated naturally then they are simply expanding their range. Are they native? Perhaps not based on the historical nativity.

I seem to recall back in the early 90's some coyotes being shot by farmers in Greene County because they were taking their sheep. One of them had a PGC tag on it. It was presumed but never admitted that the PGC introduced them covertly to control the Deer Population.
