I just saw a show on Nat Geo the other evening where they showed video of clouds of Hex's over one of the Great Lakes, it was pretty impressive.

In SE PA we have them on a lot of streams that are silty, Perky drainage has them, Bushkill in Easton has them, LL has them so the Saucon. That said they aren't a heavy hatch, but enough to get some big trout feeding on the occasional dry fly or spinner. The ones I've seen are dimorphic, females are mostly light yellow to cream, males are mostly brown on the black and yellow beneath.

They both get pretty dark as spinners. When they are ready to emerge you'll find holes in the muddy deposits along the slow silty sections of streams that have this hatch. The DH section of the LL has ideal habitat for them. Sorry no Pics, but I'll get some pics this year. The hatch goes from early August to late September. I've seen them on the Main Stem of the Upper Delaware to.
