I have, I fished one with and one without floatant. The one not treated floated lower in the film but did float. Tried it in riffles, runs and pools. I lost the none treated one in the branches above screwing around slapping it down on the water to see if it would go under. A few dry casts and off it would go. Got both shoes soaked trying to get it back. 🤔 The treated one performed very well. Gave each one a half an hour to see how it would go drifts were 15' or so. I was hoping the strip of foam would kinda give it a neutral buoyancy and help keep it on top, all in all not bad...
Hey, thanks Delta.

They are good looking flies! I had to tie some woven mayflies for a swap on another board. I don't recommend that at all, but it was an odd swap and the rules made it so I had to do it that way. After playing around for a while I decided to wax the floss with tying wax and it helped a lot, but I still wouldn't recommend it. It got me wondering if it would be worthwhile pretreating the floss with floatant or Scotchgard. All that aside, I have heard that fish take sunken hoppers (naturals) quite a bit, so a hopper that looks realistic and is a less than perfect floater might be an interesting pattern.
