Last summer was kind to the trout in the river. Lots of rain and the river stayed cool, for the most part of the summer.

The numbers of trout that are being seen in the river this year is a direct result of being able to keep the river cool with a good flow. The trout will respond accordingly. River levels are perfect right now for surface activity, so that helps too.

Shane - wouldn't it be nice to have it this way every year??? It is possible you know.

That vid is amazing for the amount of bugs. I've seen days like that in the past during those caddis hatches. Were those the grannom caddis (black body) or the green body?

BH - that first trout pictured with limited spotting is most likely a wild or fingerling grown up. The 2nd, larger more spotted, brown is likely a holdover stocked fish, but is a solid fish.

Regardless...both are nice fish to catch in a large trout river.

With all these fishys being caught, I hope people will fill out the surveys.

Last year anglers participation was very poor, however that was likely due to river levels being almost unfishable the entire summer.
