pcray1231,

I saw:

Three tails > Body size 11mm > Fore wing views don't diverge at base> Costal projection on hind wing

Which takes you to:

Drunella cornuta (BWO) or Ephemerella invaria (Large Sulphur)

The lighter body coloring of the Ephemerella invaria (sulphur) fits verse the darker body and smaller size you would find with the Drunella cornuta (BWO).

Again as with all hatches a couple of weeks early in 2012!
