Yes.

For most species, this is an evening thing, often right at dusk or after. There are exceptions. Such as tricos, where the spinner fall is the main event (since the hatch is overnight), and it occurs in the morning. I've run into daytime blue quill spinner falls too. Other than that, all the superhatches that I've been a part of, it's an evening, usually LATE evening event.

The spinner falls are the huge bonanza events, though. Hatches are usually spread out over a few hours. Spinner falls are when they swarm, and then all fall on the water in a much shorter time frame, sometimes it only lasts 15 minutes or so. Heck, in some cases, bugs from SEVERAL days worth of hatches all combine into a single swarm and fall at the same time.
