Program updates at noon and midnight. And does so slowly, adding an hour at a time. Right now it's only going out to 48 hours. This morning it was going out 120 hours.

So wait till 2 or so, then look. We'll see if it still says the same. Of course, it gets more accurate the closer you get.

FWIW, all of the rain was above 90 hours out (from midnight last night), with the heart of the storm hitting at 110 hrs or so, and continuing right through the 120 hr mark. That's essentially 30 hours of rainy weather, and 20 hours of constant rain without any breaks. That will all be moved up 12 hours in the latest run, of course.

P.S. If you wanna see it, you can change it from the 12z (noon) to the 0Z (midnight) run at the top. So you can view past runs of the model.
