Chaz,

explain why the fly pictured above has mottled wings yet no Epeorus have mottled wings.

I've seen pink cahills on penns.....Barred legs, two tails, mottled wings and a rosey-pink cast to the body with a nearly chartreuse blotch on the underside of the thorax. I thought I must have dropped acid. I called it a pink cahill here and got chastized for making up new fly names. Nevertheless, all trilogy of indicators pointed to Stenonema (prior to the lumping into Maccaffertium with the Epeorus)

Why Epeorus is lumped into there I have no idea.....The wings are not mottled in the E-genus.

Anyway, The fly pictured cannot be Epeorus because fo the wings....it could be a pink lady (cahill) but the color is wrong IMHO. So it must be a cream or Light Cahill. I stick with cream.

TN also has the Pink Lady listed as a Epeorus albertae. But again no mottled wings and the body does not have defined segmentation with contrasting color.
