Eh, not seeing much change. Keep in mind the official forecast is not what they think is going to happen. Political meteorology. For the official forecasts, they tone down the extremes. If you're expected to get swamped, they keep it lighter. If you're not expected to get anything, they say you have a chance at something.

At least till they're sure of the details.

There was always to be a break between storms Sunday. Only exception might be extreme SE corner where the Noreaster comes in just about as the front is exiting.

Frontal system enters western PA tomorrow morning. Takes about 4-6 hrs to pass any given location, 24 hrs to pass through the whole state. So for eastern PA, rain starts Saturday night and ENDS Sunday morning. Drops close to a half inch on most of the state, maybe a few holes here and there.

That's pretty much it for western PA probably. For eastern PA, the REAL storm follows. Enters from the SE early afternoon Sunday, and spreads NW ward, covering the eastern part of the state Sunday evening/night with hard rain. Tapering off Monday morning. Multiple inches of rain possible for many locations. Western extent of this bigger storm still in question, could include the central portions, and it may not. Higher elevations in NC PA still not out of the question for some snow.
