OK, I guess I was goin by the mets, who are still scaling back the prediction until they're sure.

Verbatim it looks like 20+ inches of snow for the Bradford area, 30" locally. I said a foot earlier. The foot is closer to what it shows for Pittsburgh and the Laurel Highlands (8-12" maybe, mixed with rain). Again, that's what falls, not what sticks, which is sure to be less as it'll be melting from the bottom as the storm adds to the top. Might be one of those deals where it's rain in the valleys and snow up high, too, especially further South through Johnstown to Pitt.

Eastern and central PA ranging from 2.5" to 5" of rain total over about an 18 hr period.

This is a BIG storm. Very impressive. It'd be truly historic if it happened in January or February, you'd have isolated locations with above 40" of snow, and widespread 30" totals.

Pattern changer. The warm and dry pattern is likely to reverse as it's just gonna demolish that stationary system in Canada that's steered everything out to sea. We'll be cool and in a shooting gallery for hit and miss clipper type systems for the next few weeks most likely.
