I could easily go with that. I still like Maccaffertium because of the wing veining/mottling is more severe than the pictures I'm looking at. Nonetheless, stenacron DOES have mottled wings, unlike eporeus. It fits.

By the way, I should apologize for an earlier mispost. It was Stenenoma, not Stenacron, that largely dissolved. There is only 1 species left in Stenenoma. All of the rest were moved, either to Maccafertium, or to Stenacron. Sandfly's suggestion is one of the ones that moved to Stenacron, whereas Maurice and I suggested one of the ones that moved to Maccafertium.

But the species name is no longer heterotarsale, it's now interpunctatum, lol.
