another article about a family not far from me.

I'm hoping this doesn't happen to my well, but I will say this, if it does, I will not go quietly.

Did you get your well tested prior to any drilling activity so that you have a basis to compare any post drilling problems?

The article doesn't actually identify if there are any issues with the water other than some non-threatening sediment. The author would have a more informative article if they had gotten an independent expert to analyze the DEP report the woman received.

A lot of the issues with well water are often not water quality issues from a health standpoint but may be visible changes to the water. The DEP should do a better educational job on these problems.

It's likely a simple inline water filter would have removed the sediment. IMHO this is something that should be installed on the primary drinking supply line in any house that has a well. (I installed one in my camper as well.)
