Anytime now the trout in those mountain streams will switch to terrestrials, so always carry some anys and beetles as well as inch worm imitations (green weenies). Trout will be in the heads and tails of pools unless the water is low slow and clear, on bright sunny days they just hide. I ran into that a bit myself this week. Looks like the entire state is getting needed rain this morning and today so streams will be coming up. But things that worked earlier in the year don't work under low slow and clear conditions as well. Look for small yellow and lime sallies (stoneflies). Trout eat them in good numbers. Also many mountain streams have hatches of Isonychias in #14 have some of the spinners available and some duns. Even though the duns don't hatch directly from the water trout know what they are. I was seeing them this past week up near camp.
