I think there are two separate species. Limbata, I believe, is the early one, usually early June.

Like this story, timing is about right:

<http://old.post-gazette.com/regionstate/20010608mayflies0608p2.asp>

And then the later ones are bilineata, like this:

<http://bugguide.net/node/view/326392>

On the trout streams of NW PA, I've mostly ran into Limbata. I think the bilineata's tend to stick to the extreme western edge of the state.
