Sweet Jesus! That certainly is a worst case scenario--it looks like a nuclear holocaust.

Pcray, indulge me if you dont mind because wikipedia didnt offer much information on the subject. Why is this algae more prevalent in coldwater streams? I have always known algae to thrive in the warmest water possible. If water temps play a large role in the survival of this species, will we see its presence less and less as we travel downstream on the yough(water temps rising)? Finally, what causes those massive blooms, and has anything like that ever happened in the delaware?
