There is no solution beyond somehow poisoning it (which would likely poison everything else too).

Likewise, a felt ban will almost certainly not stop the spread. It may slow the spread, which would be looked at as a victory. But since it's not only felts that spread it, but also natural forces like birds, it is almost certain that virtually every waterway will be exposed to it eventually.

How soon, and how much impact will it have are open questions.

I've been curious lately as to which waterway they'll try a poisoning/treatment in first. It's only a matter of time before they test out some theories on how to get rid of this stuff.

I bought my first pair of rubber soled boots last month. Felt very comfortable compared to felts.

I've fished like 5 times total this year, so it sucks less for me than those who are avid Youghers. I was planning on getting to know that stream a bit more here in the near future.
