We should be getting some people from France, Quebec, China, and Russia to talk about nuclear power generation to the people of our state. Go around the globe, look at every country who wants to produce megawatts with nuclear(not megatons).

China pushes the envelope with fast neutron reactors attaching to the grid, building as fast as they can. Gates talking to China about fourth gen reactors. Russia working with China (????) on nuclear power. South America trying to save the rainforest with nuclear power instead of fracking it up.

But, the country that has such rich nuclear history, well, we have fracked gas. Pathetic. Look at all the pretty little wind turbines we'll load balance this gas with. It's so green and pretty they say.

It's not, and it requires a ton of energy to produce those turbines, and they are intermittent, and they still get destroyed in high wind.

There has always been a very concentrated effort to stifle nuclear power in this country(not referring to environmentalists who think they are fighting the good fight), as recently as Yucca mountain, and now Gasmerica: Frack for Freedom.

When Japan got hit(with old reactors), the gas industry cheered, because now they had a new boogie man, a new Chernobyl.

We need new reactors, they are much better than gas/wind/solar at this point in time. We are going to need to desalinate water, and we do not want to do that with gas.
