Front claspers to end of tail was as long as a cigarette

Claspers are on the rear of the abdomen (near tail) on the underside of the male spinner, used for mating. Hooking up!

Who knew the contemporary term for having sex in the younger generations vocabulary came from mayflys?

The front legs are called forelegs.

Cigarettes are called cancer sticks or coffin nails. Not to be confused with coffin flys.

I wasn't aware of the technical terms. Thank you. Lol on the cig thing also.
