JD,

Agree with all of the above.

The dam control is the best it can be under the current conditions (limited cold water pool).

Also, Westbranch is a 5 star guy, and I believe his observations about the brown trout struggling to stay alive. As I posted, I saw the exact same thing not long ago in similar water temp conditions, in the same stream section.

Long and short, the stream cannot sustain many stocked trout through the summer. The release of cool water will end any week now, and the stream temps will rise well into the 70's through late July and August, depending on the weather.
