Well, aside from the water temp thing, there's a water chemistry thing too. But yes, I agree, if something bad happens to Pine, it's certainly harmful to Penns too.

Though I have to echo foxgap's inquiry. I am NOT saying there's no danger, I really have no idea. But I need more information.

Quote:

This most likely will affect Pine Creek.

That's a strong statement that implies a specific concern. What is that concern? HOW will this effect Pine Creek? What is the mechanism?

Are we talking siltation? Heavy metals? Dewatering? Warming? And why would the planned actions result in these problems?
